Subject: Glyphosate NSRL
Date: Wednesday, June 07, 2017 11:27:47 PM

The proposed level of 1100 micrograms No Significant Risk Level (NSRL) of glyphosate, an ingredient in RoundUp. Studies show 1100 micrograms daily to be far too high of an exposure level. In comparison, chemical 2,3,7,8-Tetrachlorodibenzo-p -dioxin (TCDD), also on the Prop 65 list, has an NSRL Of .000005 micrograms per day. Because glyphosate has been shown to bioaccumulate and has been shown in [the parts per trillion](#), to increase the growth of breast cancer cells, the reality is that there is no safe level of glyphosate exposure to humans, especially babies.
